To run the test cases type `*make*` then `*make test*`.

This will produce output files `test.out` and `typeErrors.out` which is the parsed version of the inputs.

It will also produce `test.err` and `typeErrors.err` which is the collection of errors generated by the type checker.

`Test.err` should be empty.

The number of errors in `typeErrors.err` is specified in comments in `typeErrors.cimple`

`*make test*` will also compare the error files to the expected errors in files `expectedTest.out` and `expectedTypeErrors.out`.

The result of the `diff` command should show that the files are the same.
